

Zero Waste Boxes Offer Customers a Turnkey Solution for their Hard-To-Recycle Waste

The Zero Waste Box™ system is the first comprehensive recycling solution for everything, developed by award-winning waste experts at TerraCycle®.

Whether you're looking to recycle coffee bags, beauty products or DVDs and CDs, the Zero Waste Box system is a turnkey, all-inclusive recycling solution for hundreds of items that are typically considered "non-recyclable" through traditional council recycling systems or TerraCycle's National Recycling Programmes (<https://www.terracycle.com/en-GB/brigades>).

The Zero Waste Box™ system is convenient and easy to use, making it the perfect option for households, schools, businesses, manufacturing facilities, and events looking to offset their impacts and lighten their footprint.

Zero Waste Boxes™ come in one of three sizes, small medium and large, depending on the quantity and type of waste being recycled, and the prices vary depending on box size and the difficulty of recycling each waste stream. The price of each box includes the cost of TerraCycle sending it to the customer, the prepaid shipping label which the customer then uses to send their full box back to TerraCycle, and the cost of processing the waste.

The All-In-One and Plastic Packaging Zero Waste Boxes

How Does it Work?

There are 3 steps to recycling through the Zero Waste Box™ system.

1. Customers select their preferred Zero Waste Box™ on the Zero Waste Box website (<https://zerowasteboxes.terracycle.co.uk/collections/all-zero-waste-boxes>), choosing their desired waste stream and box size.
2. Customers then fill their Zero Waste Box™ with the specified waste stream. This could take several months depending on the waste stream.
3. Customers then use the prepaid and pre-attached shipping label to send their box back to TerraCycle where it will be sorted and sent for processing.

The recycling

In order to recycle this waste, TerraCycle partners with a number of third-party processors who turn the waste into a reusable raw material. The waste we send for recycling is shredded, washed and turned into an agglomerate or pellets. These pellets can then be melted down and moulded by manufacturers into new products such as outdoor furniture, planters and even playgrounds for schools.
